02-Iul-12.3:00:00	

Na het runnen van het eerste deel van de code die hier onderstaat.

```
Sub Opsplitsing()
3 Application.ScreenUpdating = False
5 Dim a, b, c, d As Integer 'a=rij b=locatie binnen string c=colom d=vorige locatie ";"
6 Dim aantal As Integer
7 Dim inhoud As String
9 ' Waarden uit CSV moeten in colom 1 staan
10 a = 1
11 Do While Cells(a, 1) <> ""
    c = 2
d = 1
14 aantal = Len(Cells(a, 1))
     inhoud = CStr(Cells(a, 1))
For b = 1 To aantal
        If Mid(inhoud, b, 1) = ";" Then ' Dit werkt alleen voor ",", als het anders is gesepareerd voeg het dan toe
18
             Cells(a, c) = Mid(inhoud, d, (b - d))
              c = c + 1
              d = b + 1
        ElseIf b = aantal Then
             Cells(a, c) = Mid(inhoud, d, (b - d + 1))
         End If
     Next b
26 Loop
   Columns(1).EntireColumn.Delete
```

Het excel ziet erdan als volgt uit.

```
11-2 Canada

11-2
```

Vervolgens gaan alle kolommen met dezelfde naam worden verwijderd. Door de volgende stukje code.

```
' eventueel code voor verwijderen dubbele colommen (afhankelijk van hoe constant colomnamen zijn)
   c = 3
32 Do While Cells(1, c) <> ""
      If IsNumeric(Left(CStr(Cells(1, c)), 3)) = False Then
34
           Columns(c).EntireColumn.Delete
           c = c - 1
36
      End If
   c = c + 1
38
    Loop
40
   Application.ScreenUpdating = True
41
   End Sub
43
```

De excel sheet veranderd dan en er worden door de code 12 kolommen gedropt.
